GENERAL INFORMATION

SIMPLWINDOWS NAME:	Denon AVR-4311CI v1.0
CATEGORY:	AV Surround Processor
VERSION:	1.0
SUMMARY:	Controls all of the standard functions and provides true feedback.
GENERAL NOTES:	<p>This module will control all of the standard functions on a Denon AVR-4311CI AV Surround Receiver.</p> <p>The unit provides true feedback. Functions provided include main zone control, zone 2 control and zone 3 control, surround mode selection, surround speaker level adjustments, and tuner band/preset selection. It is necessary to pulse the initialize once to synchronize unit's settings with the controller. This initialization takes approximately 5 seconds.</p> <p>Note: For surround mode selection, certain selections are only valid while certain sources are selected. So choosing a particular surround mode may actually cause a slightly different mode to be activated on the Denon system. However, since true feedback is provided, the actual surround mode currently active will be reflected on the output of this module. The AVR-4311CI has an available surround back amplifier channel. If no surround back speakers are used in the main room, their amplifier channels can be assigned for multi-zone use or the front speaker's Bi-Amp connection. iPod and USB control are available at this time. Manufacturer states that presets are made through menu structure of unit. Preset memory store functions controlled from the panel are assigned to slots selected with preset up/down.</p> <p>To check vendor firmware, hold status and return buttons and cycle power.</p> <p>This module was tested with the Denon AVR-4311CI. Denon uses the same protocol on most of their receivers. This module should also work on the following models:</p> <ul style="list-style-type: none"> • AVR-3311CI • AVR-2311CI • AVR-4310CI • AVR-5308CI
